Email-Analyzer-Python

The objective of this project is to develop an automated procedure to analyze email inboxes, identify and download attachments in .json and .pdf format, and perform subsequent analysis on these files. If no files with the specified extensions are found, the procedure is skipped.

Features

- Connect to email accounts using IMAP. - Search emails based on specific filters (e.g., subject, sender). - Download attachments in .json and .pdf formats. - Log activities and errors for monitoring and debugging. - Configurable via a `config.json` file.
